## Abstract

Type material for 378 nominal species of protists are in the Invertebrate Paleontology Collections of Yale University's Peabody Museum of Natural History. Primary types for 186 nominal species include 112 holotypes, 1057 syntypes (representing 70 nominal species) and 27 lectotypes. Secondary types for 126 nominal species include 537 paratypes (representing 40 nominal species) and 736 paralectotypes (representing 86 nominal species). Tertiary types of 269 nominal species include 1785 hypotypes. Most types are from Arizona, Bolivia, Coahuila (Mexico), Kansas, Nebraska, New Mexico, Oklahoma, and Texas, and have been described by C.O. Dunbar, C. A. Ross, F.F. Sabins, J.W. Skinner, M.L. Thompson and T.E. Williams.

## Introduction

This catalog lists all known protist types in the Invertebrate Paleontology Collections housed in Yale University's Peabody Museum of Natural History. This is the fifteenth in a series of type catalogs of fossil invertebrates and is a product of an ongoing computerization project to improve the accessibility of the type collections.

Thirty-four type specimens are missing and cannot be located. The collections have been thoroughly searched by the curatorial staff in the 1960s and 1990s and it is believed that these specimens are permanently lost. Missing specimens are indicated with a footnote, and any information on their whereabouts would be greatly appreciated.

## Organization

Specimens are listed under the originally described binomen; genera and species

within genera are indexed alphabetically. Each entry includes the catalog number used by the Division of Invertebrate Paleontology prefixed with the abbreviation YPM and the type status of the original designation, followed by all known references to that name. Any subsequent designations are listed under the original designation and are cross-referenced in the body of the text. Locality descriptions follow each entry or set of entries for each binomen. Errors and inconsistencies are footnoted at the bottom of each binomen.

The type designations used are holotype, syntype and lectotype for name bearers; paratype and paralectotype for secondary types; hypotype is used for all tertiary types. Name bearers and secondary types are defined as used in the International Code of Zoological Nomenclature (ICZN 1985). Tertiary types or hypotypes are treated here as any specimens used in an original species description but not explicitly designated primary or secondary types, any described, figured or measured specimen used in a publication to augment the knowledge of a previously defined species, or any referenced specimen that cannot be placed unequivocally in a known species (e.g., Schwagerina sp.).

Locality descriptions follow each entry or set of entries with identical locality data. The locality information includes the stratigraphy, geography, collector and date. Stratigraphy has been standardized using Stratigraphic Nomenclature Databases for the United States, its Possessions and Territories (MacLachlan et al. 1992).
